## Inpatient Stroke Alerts: Assessing the Need for Inpatient Stroke Education

Karan Topiwala MBBS, Karan Tarasaria MBBS, Dawn Beland RN, SCRN, Erica Schuyler MD, Amre Nouh MD, FAHA. Hartford Hospital – University of Connecticut – Department of Neurology – Hartford CT, USA

#### BACKGROUND

- In-patient stroke alerts vary among patient-care settings abundance of stroke mimics.<sup>1</sup>
- $\bullet$  Low treatment rates with (IV) thrombolytics (tPA) or thrombectomy (MT) are observed typically due to contrai related to acute illness.<sup>2</sup>
- $\bullet$  The true treatment gap however has not been identified.

#### OBJECTIVE

 $\bullet$  To evaluate inpatient stroke alerts and direct education accuracy and appropriate call frequency

#### METHODS

- $\diamond$  A Retrospective study was performed identifying all inpation alerts from March 2017 to March 2018. Clinical, radiog demographic patient data were collected.
- Data was analyzed to determine the clinical or radiographic the stroke alert, prevalence of true stroke, stroke mimics, rates (IV tPA and/or MT) and barriers to treatment (Table 1)

#### RESULTS

- $\bullet$  Out of 211 codes, 36% (n=76) of patients had an acute stroke.
- ♦ Common admission diagnosis: cardiovascular 40.7% (n=86), followed by neurologic 14.2% (n=30) and sepsis 12.8% (n=27).
- Treatment rates: IV tPA [3.4% (n=3) among 87 tPA-eligible patients] and EVT [2.4% (n=5) among 9 large vessel occlusion (LVO) IS.
- $\Rightarrow$  80% of tPA eligible patients were found to be stroke mimics, however < 5% within this cohort, received reperfusion therapy.

#### CONCLUSION

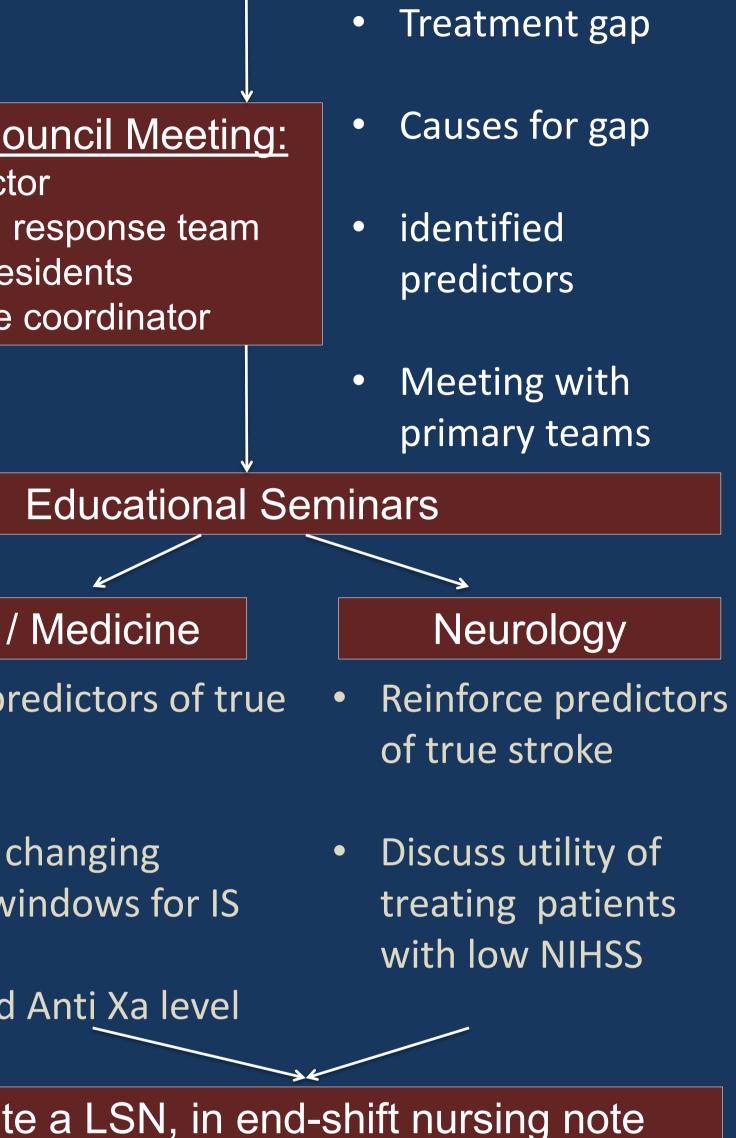

- $\diamond \sim 1$  in 3 inpatient stroke alerts were found to have a true stroke.
- $\diamond$  Treatment Gap = tPA-eligible-but-untreated patients who had an IS = 18% (n=15/84) = missed treatment opportunity of 1 in 6 patients
- Dedicated education for teams managing these patient populations is needed to improve stroke alert accuracy and call appropriateness to balance resources and improve care.

encephalopatny (23%, n=47) and abnormal blood pressure or blood sugar (6.3%, n=13)

tracking treatment gap and compliance
